Cookie and browser storage policy

Updated: 18 October 2026. Document package: 2026-10-18.2. Read this page together with our Privacy Policy.

Authentication and security

When you sign in, first-party authentication cookies keep you signed in and allow your session to be renewed. Separate anti-CSRF cookies protect requests that change account data. Authentication cookies are removed by the logout endpoint. Token validity and cookie persistence are different: a token can expire while a browser session cookie remains. These cookies serve the account service you request, rather than advertising.

Preferences and dataset drafts

Browser local storage remembers your theme, dataset form drafts, the current form step and editing context. Drafts can contain the information you type into the dataset form. Unlike session cookies, local storage has no automatic expiry. The application clears relevant drafts after successful submission, when resetting forms and after successful account deletion, while preserving your theme preference; you can also clear this site's storage in your browser. Avoid leaving drafts on a shared device. A local account-deletion notification allows other tabs to clear account state and drafts. It contains no email address, password or verification code. The server cannot directly erase browser storage on another device.

Google reCAPTCHA

Google reCAPTCHA v3 is used for explicit scientific search, sign-in, registration, registration-code confirmation and resend (including continuation from sign-in), and password-recovery attempts. Each explicit protected action requests a fresh token; a sign-in token is not reused for confirmation or resend. The integration loads from www.recaptcha.net only after an attempt, rather than on a page visit or session check. This is a Google-operated domain; it reduces use of unrelated google.com cookies but does not make the service independent of Google. It is not loaded for initial scientific-data lookup, authenticated submission, viewing, editing or account deletion. Those actions retain their own authentication, access, CSRF and request-limit protections.

Once loaded, reCAPTCHA can process IP address, browser and device information and technical and interaction signals for security risk analysis, including through the _GRECAPTCHA security cookie described by Google. Google determines its cookie lifetime; your browser can show the attributes of the cookie actually set. No universal lifetime for every Google signal is promised here. A verification token expires after two minutes and is single-use; that is different from cookie or provider-data retention. The site's short-lived token queue does not store tokens in local storage or cookies.

The eligible routes are search, sign-in, registration and password recovery. After an explicit action, a separate same-origin frame loads reCAPTCHA. Leaving an eligible route removes that frame and cancels pending verification while the main page shell remains in place; navigation does not reload the whole document. This does not erase an existing Google security cookie. Google's current data-processing information, Cloud Data Processing Addendum and service-specific terms describe the security purpose and processor role for Customer Data under the applicable service agreement. These terms do not govern consumer Gmail. Recipient, international-transfer and rights information is in our Privacy Policy.

If an automated check blocks a legitimate attempt, retry or contact support@wwhypdatestdeployversion.it for human review. This contact and the legal pages do not require CAPTCHA or an account.

Your controls

You can delete or block cookies and local storage using your browser's site settings. Blocking essential storage can prevent sign-in or draft recovery; blocking reCAPTCHA can prevent protected requests. No advertising or analytics integration is implemented in the application code reviewed for this policy. A future optional tracking feature must not be enabled before any legally required consent and must offer a way to withdraw that consent.

Under Italian rules, strictly necessary technical storage does not require a consent banner, but it does require information. This exemption does not automatically apply to every third-party script: the controller must assess the deployed reCAPTCHA configuration and any additional tracking. See the Garante's cookie guidance.

For privacy requests and information about recipients and international transfers, use the contacts in our Privacy Policy.
